

reflectiz

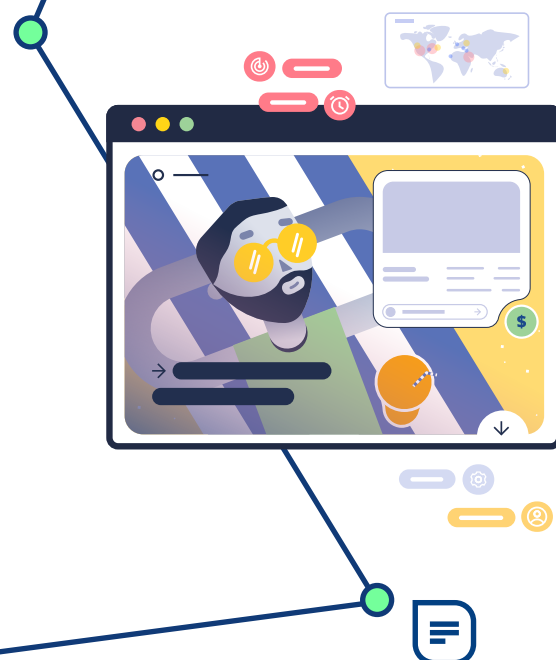

END-TO-END WEB EXPOSURE MANAGEMENT

A one-stop approach to manage your web risks

Reflectiz offers a proactive website security solution that continuously detects, prioritizes, and validates web threats, helping to reduce security, privacy, and compliance risks.

By continuously monitoring your web exposure, Reflectiz empowers your organization to stay ahead of potential threats. All executed remotely for hassle-free implementation.

You can't protect what you can't see

Today's websites are connected to dozens of third-party web apps, trackers, and open-source tools like social pixels, tag managers, and JS frameworks to maximize your online business potential. These external web components are not always visible to standard security controls, and they often expose you to security threats.

The result:
**Your web threat exposure is larger than
you think.**

Reflectiz shields your web assets from security threats and privacy issues

Stop web-skimming and magedom

Full protection against a new, advanced attack method

Oversee all web assets from one dashboard

Proactively combat increasingly sophisticated web-based cyber threats

Detect unlawful tracking pixel activities

Enable tag manager use w/o compromising website security

Enforce website privacy

Protect your clients' data to minimize the risk of compliance violations and fines

Support PCI DSS v4 compliance

Meet the new PCI-DSS v4 requirements and avoid costly fines

Prevent web supply chain attacks and risks

Prevent vulnerabilities in your web app supply chain, and ensure all is working as intended

66%

of companies didn't find the data breach internally, highlighting the need for better detection*

\$ 4.45M

is the average cost of a privacy data breach in the USA

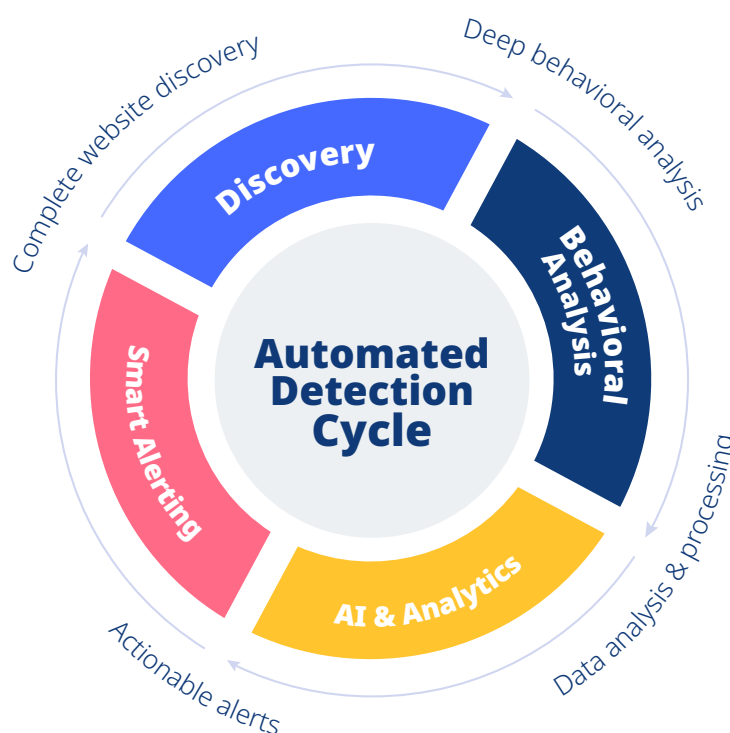

\$2.1B

the total amount of GDPR fines in 2023

The most advanced web analysis

Reflectiz has developed a unique proprietary browser that dynamically explores every webpage on a website, mimicking the actions of a regular user.

This capability enables comprehensive monitoring and analysis of all activities occurring on a webpage, including the behaviors of loaded components, Javascript executions, and network requests. As a result, Reflectiz provides a broader view of the immediate risks and threats faced by your websites.

* Source: <https://www.ibm.com/reports/data-breach>

Reflectiz analysis asks three main questions:

WHO

Discover **WHO** your third-party vendors and open-source tools are, and compile them into a comprehensive web inventory.

WHAT

Understand **WHAT** the behaviors of these third-party vendors and open-source tools are, and the related security impact of their actions.

WHERE

Map the interactions between your third-party vendors and open sources, and uncover **WHERE** your third parties communicate data with.

One dashboard to rule your website security

Complete inventory

Ensures full visibility into every element impacting website security and privacy - allowing deeper explorations into specific risks.

Exposure Rating

Measures the risk exposure level of your websites in context and comparing them to others in your industry.

Continuous Baseline

Utilizes a vast intelligence database to effectively address the most critical and uncommon threats and issues in your web environments, enabling users to make informed decisions and reduce alert fatigue.

Maximum security at your fingertips

Quick time to value

Get value from day one by utilizing a vast intelligence database to identify and prevent risks in your website right from the start.

Remote monitoring solution

Effortless launching with no code implementation and zero impact on website performance.

Proactive security approach

Go beyond vulnerability patching and take a proactive approach to combat sophisticated web threats, gain deeper visibility, and mitigate security and privacy risks before they strike.

Risk prioritization

Create a security baseline that aligns with your company's risk appetite to reduce alert fatigue.

Supply chain analysis

Obtain a comprehensive vendor overview to detect supply chain risks early and prevent the possibility of a devastating supply chain attack.

Security posture validation

Detect misconfigurations, outdated components, inefficient security rules, and more, to prevent security gaps and maintain a robust security posture.
